(a) $c \geq \theta$: dense block (Eq. 1)

$c = 3 \geq \theta{=}2$

$occ(X)[i_{\text{start}} + c - \theta] = occ(X)[1] = 2, \quad l \leftarrow 2{+}1 = 3$

(b) $c < \theta$: jump (Eq. 2)

$c = 1 < \theta{=}2$

$l \leftarrow occ(X)[i_{\text{end}} + (\theta{-}c) - 1] - W = 8{-}3 = 5$
